

A bibliometric analysis of the top 100 cited articles on hidradenitis suppurativa

In the past three decades, there has been enhanced awareness of the prevalence and risk factors associated with hidradenitis suppurativa (HS). This is reflected in the growing number of review articles and clinical studies on HS, which has contributed to elucidating the pathogenesis and the development of biologics in treating this debilitating disease. We bring to light these developments in HS by identifying and analysing the top 100 cited HS articles published in the past 30 years.
