

Skin thinking, artificial intelligence and dermatology

Is the natural intelligence of the Dermatologist at risk of being surpassed by the artificial intelligence of the machines that they train?

There is an ever-increasing body of evidence indicating the success of artificial intelligence in various facets of dermatology from diagnosis of malignant lesions, in particular melanoma, to grading of psoriasis. We present an update of the literature, a synopsis of our groups current research in this area, and take a glimpse into the future of Dermatology in the era of artificial intelligence.
